WO 2005/051193 PCT/AU2004/001656

- 33 -

CLAIMS:

1. A method of assessing a sensory nervous system of a subject, including:

simultaneously presenting two or more parts of the sensory system with respective sequences of stimuli,

5 varying each sequence over time between a null stimulus and one or more less frequent non-null stimuli,

controlling the variation of each sequence so that neighbouring parts of the sensory system are less likely to receive simultaneous non-null stimuli,

measuring one or more simultaneous responses by the subject to the sequences of 10 stimuli, and

determining weight functions from the responses for assessment of the sensory system.

- 2. A method according to claim 1 wherein the non-null stimuli appear in each sequence at a rate of about 0.25 to 25 per second.
 - 3. A method according to claim 1 wherein the probability of neighbouring parts in the sensory system having simultaneous non-null stimuli is zero.
- 20 4. A method according to claim 1 wherein the sensory system is a visual system and multiple parts of a retina are presented with stimuli.
 - 5. A method according to claim 1 wherein the sensory system is a visual system and the sequences includes either binocular or dichoptic stimuli.

- 6. A method according to claim 1 wherein the sensory system is an aural or tactile system and the ears or skin are presented with stimuli.
- 7. A method according to claim 1 wherein the parts of the sensory system are 5 in the retina, the ears, the skin, or in the brain of the subject.
 - 8. A method according to claim 1 wherein the stimuli are selected from a range of signals such as light or sound frequency, or pressure.
- 9. A method according to claim 1 wherein the parts of the sensory system receiving stimuli form a region divided into classes and only one of the classes has a non-zero probability of receiving stimuli at any time.
- 10. A method according to claim 1 wherein the responses are nonlinear and the15 weight functions are Wiener or Volterra kernels.
 - 11. Apparatus for assessing a sensory nervous system of a subject, including:
 - a stimulator that simultaneously presents two or more parts of the sensory system with respective sequences of stimuli,
- a monitor that measures one or more simultaneous responses by the subject to the 20 sequences of stimuli, and
 - a processor that varies each sequence over time between a null stimulus and one or more less probable non-null stimuli,
 - controls the variation of each sequence so that neighbouring parts of the sensory system are less likely to receive simultaneous non-null stimuli, and
- determines weight functions from the responses for assessment of the sensory system.

WO 2005/051193 PCT/AU2004/001656

12. Apparatus according to claim 11 wherein the sensory system is a visual, aural or tactile system and the stimulator presents optical patterns to the eyes, ears or skin of the subject.

5

13. Apparatus according to claim 11 wherein the monitor measures responses to the stimuli by way of electrode potentials on the head of the subject.
